WHAT IS CLAIMED IS:

1. A fibrous nonwoven sheet printed with a given pattern using an electrophotographic process comprising the steps of
5 photoconductively forming an electrostatic latent image on a photosensitive body, electrostatically depositing colored toner (charged fine grains) on said electrostatic latent image to convert said electrostatic latent image to the corresponding visible image and transferring said visible image onto a surface
10 of said fibrous nonwoven sheet, wherein:

said fibrous nonwoven sheet is made of a plurality of thermoplastic synthetic resin fibers and has a given thickness, said toner has having an outer layer slightly permeating said fibrous nonwoven sheet through a surface thereof and deposited
15 around fibers lying in a vicinity of said surface of said fibrous nonwoven sheet and an inner layer deposited around fibers immediately underlying said surface and respective pairs of adjacent portions of the toner being not mingled together and present on the fibrous nonwoven sheet in the form of a plurality
20 of independent dots.

2. The fibrous nonwoven sheet according to Claim 1, wherein said outer layer has a thickness dimension in a range of 1 -

- 17 -

100 μ m.

3. The fibrous nonwoven sheet according to Claim 1, wherein said outer layer exposed on said surface of said fibrous
5 nonwoven sheet has a surface area in a range of 10 ~ 100 μ m.

4. The fibrous nonwoven sheet according to Claim 1, wherein a thickness dimension of said toner inclusive of said outer layer and said inner layer is 10 μ m or larger and less than a
10 thickness of said nonwoven sheet itself.

5. The fibrous nonwoven sheet according to Claim 1, wherein said fibrous nonwoven sheet is used as at least a liquid-impervious backsheet in a disposable body fluid absorbent
15 wearing article comprising a liquid-pervious topsheet, said liquid-impervious backsheet and a liquid-absorbent core disposed between said top- and backsheets.
